

POLYWIZZ FORM CREATION APP

The Web Application core functionality is to be able to create forms on pre-existing pdf files, send the link to customers via email, SMS or WhatsApp.

The Application has a page named Add New Document: This page is a page for Agents to upload files, after uploading the file, he will be automatically redirected to a new page named where he will be able to add forms to the file.

In this page, there are few tool boxes in the toolbar with tooltips, the tools here are the color palette tool, font size selection box, brush size selection box, text tool, rectangle tool, pen tool, the input image tool, the delete tool and the Save button. The Agent can drag boxes over the document via the rectangle tool, he can input texts via the text tool, he can input signature via then Pen tool, can delete previous activities with the delete button or even clear all he has done, When he is done, he hits the Save button, the file gets downloaded on his personal PC/Phone.

With the attempt to get it across to customers, he will upload the newly created form document in another page named Upload Form Document, after uploading, he will be redirected to the customers table where he will select the customer he wants to send it to via email, sms/whatsapp, the customers get the link to the file in their inboxes.

The customer clicks the link, they will be redirected to the website and fill the necessary part of the document with the tools available on the website. Then they will be able to download the filled form on their devices.
